Natures Mind The Biological Roots Of Thinking Emotions Sexuality Language And Intelligence

Nature's Mind-Michael Gazzaniga 1994-04-20 The co-discoverer of the “split brain” theory tells how science is recasting the age-old question of nature versus nurture to create a startling new view of human behavior. Recent discoveries suggest that natural selection affects not only physical characteristics but also mental processes, from learning to substance abuse.

The Mind's Past-Michael S. Gazzaniga 1998-05-07 Why does the human brain insist on interpreting the world and constructing a narrative? In this groundbreaking work, Michael S. Gazzaniga, one of the world's foremost cognitive neuroscientists, shows how our mind and brain accomplish the amazing feat of constructing our past—a process clearly fraught with errors of perception, memory, and judgment. By showing that the specific systems built into our brain do their work automatically and largely outside of our conscious awareness, Gazzaniga calls into question our everyday notions of self and reality. The implications of his ideas reach deep into the nature of perception and memory, the profundity of human instinct, and the ways we construct who we are and how we fit into the world around us. Over the past thirty years, the mind sciences have developed a picture not only of how our brains are built but also of what they were built to do. The emerging picture is wonderfully clear and pointed, underlining William James's notion that humans have far more instincts than other animals. Every baby is born with circuits that compute information enabling it to function in the physical world. Even what helps us to establish our understanding of social relations may have grown out of perceptual laws delivered to an infant's brain. Indeed, the ability to transmit culture—an act that stems from the human repertoire—may stem from our many automatic and unique perceptual-motor processes that give rise to mental capacities such as belief and culture. Gazzaniga explains how the mind interprets data the brain has already processed, making "us" the last to know. He shows how what "we" see is frequently an illusion and not at all what our brain is perceiving. False memories become a part of our experience; autobiogaphy is fiction. In exploring how the brain enables the mind, Gazzaniga points us toward one of the greatest mysteries of human evolution: how we become who we are.

Cognitive Biology-Gennaro Auletta 2011-07-14 Providing a new conceptual scaffold for further research in biology and cognition, this book introduces the new field of Cognitive Biology: a systems biology approach showing that future progress in this field will depend on a deep recognition of developmental processes, as well as on the consideration of the developed organism as an agent able to modify and control its surrounding environment. The role of cognition, the means through which the organism is able to cope with its environment, cannot be underestimated. In particular, it is shown that this activity is grounded on a theory of information based on Bayesian probabilities. The organism is considered as a cybernetic system able to integrate a processor as a source of variety (the genetic system), a regulator of its own homeostasis (the metabolic system), and a selecting system separating the self from the non-self (the membrane in unicellular organisms). Any organism is a complex system that can survive only if it is able to maintain its internal order against the spontaneous tendency towards disruption. Therefore, it is forced to monitor and control its environment and so to establish feedback circuits resulting in co-adaptation. Cognitive and biological processes are shown to be inseparable.

Gesture and the Nature of Language-David F. Armstrong 1995-03-16 This book proposes a radical alternative to dominant views of the evolution of language, in particular the origins of syntax. The authors draw on evidence from areas such as primatology, anthropology, and linguistics to present a groundbreaking account of the notion that language emerged through visible bodily action. Written in a clear and accessible style, Gesture and the Nature of Language will be indispensable reading for all those interested in the origins of language.

Darwin and International Relations-Bradley A. Thayer 2015-01-13 Pathbreaking and controversial, Darwin and International Relations offers the first comprehensive analysis of international affairs of state through the lens of evolutionary theory. Bradley A. Thayer provides a new method for investigating and explaining human and state behavior while generating insights into the origins of human and animal warfare, ethnic conflict, and the influence of disease on international relations. Using ethological and statistical studies of warfare among tribal societies, Thayer argues that humans wage war for reasons predicted by evolutionary theory - to gain and protect vital resources but also for the physically and emotionally stimulating effects of combat. Thayer demonstrates that an evolutionary understanding of disease will become a major part of the study of international relations as new strains of diseases emerge and advances in genetics make biological warfare a more effective weapon for states and terrorists. He also explains the deep causes of ethnic conflict by illuminating how xenophobia and ethnocentrism evolved in humans. He notes that these behaviors once contributed to our ancestors' success in radically different environments, but they remain a part of us. Darwin and International Relations makes a major contribution to our understanding of human history and the future of international relations.

What Biological Functions Are and Why They Matter-Justin Garson 2019-01-31 This accessible book presents a new theory of biological functions and connects it to contemporary problems in philosophy and science.

EVOLVING AN INTEGRAL ECOLOGY OF MIND-Chris Lucas 2009-09-01 A "revolution" in the cognitive sciences has irrevocably transformed our basic understanding of the mind, establishing that imagination is both a synthesis and critical review of significant theory and research on all aspects of giftedness, both to help frame more valid research questions and to provide guidance for educational policy and practice.

The Variables of Moral Capacity-David C. Thomasma 2004-09-20 Moral capacity is an important feature of what it means to be human. In this volume, the contributors have taken on the daunting task of trying to distinguish between legal and moral capacity. This distinction is difficult at times for clinicians, philosophers and legal scholars alike. Part of the challenge of defining moral capacity lies in the difficulty of adequately categorizing it. For this reason, the editors have chosen to divide the book into three parts. The first looks at the concepts involved in the discussion of moral capacity; the second considers the role of moral capacity in the lives of professionals; and the final part reflects on case studies of moral capacity or incapacity illustrating the challenge that moral capacity presents - its definition lying between two seemingly incommensurable models, of interest to the threshold and continuum. This volume takes a multidisciplinary approach to the subject, and ties the disciplines of medicine, philosophy and law into the health context. It will be of interest to medical health professionals as well as researchers working in the areas of philosophy and law.

Mapping the Mind-Rita Carter 1998 Covers the multiple functions of the complex human brain, providing graphics and simple terminology and sidebars written by experts in the field of brain mapping.

Hidden Minds-Frank Tallis 2002 The author confirms the existence of the unconscious mind and traces its importance, using hypnosis, psychoanalysis, subliminal manipulation, dreams, and hard science to trace the existence of this "hidden mind" within each individual. 15,000 first printing.

On the Origins of Human Emotions-Jonathan Turner 2006-06-01 Language and culture are often seen as unique characteristics of human beings. In this book the author argues that our ability to use a wide array of emotions evolved long before spoken language and, in fact, constituted a preadaptation for the speech and culture that developed among later hominids. Long before humans could speak with words, they communicated through body language their emotional dispositions; and it is the neurological wiring of the brain for these emotional languages that represented the key evolutionary advantage in their ability to communicate with each other.

Extrarextral Straltruis -Douglas A. Vakoch 2013-09-14 Extrarextral Straltruis examines a basic assumption of the Search for Extraterrestrial Intelligence (SETI) that extraterrorists will be transmitting messages to us for our benefit. This question of whether extraterrorists will be altruistic has become increasingly important in recent years as SETI scientists have begun contemplating transmissions from Earth to make contact. Technological civilizations that transmit signals for the benefit of others, but with no immediate gain for themselves, certainly seem to be altruistic. But does this make biological sense? Should we expect altruism to evolve throughout the cosmos, or is this only wishful thinking? Is it dangerous to send messages to other worlds, as Stephen Hawking has suggested, or might humankind benefit from an exchange with another galaxy? Would extraterrorist societies be based on different ethical principles, or would we see commonalities with Earthly notions of morality? Extrarextral Straltruis explores these and related questions about the motivations of civilizations beyond Earth, providing new insights that are critical for SETI. Chapter authors are leading scholars from diverse disciplines—anthropology, astronomy, biology, chemistry, computer science, cosmology, engineering, history of science, law, philosophy, political science, physics, psychology, security studies, and sociology. Directors of the SETI Institute and professor of clinical psychology at the California Institute of Integral Studies. The Foreword is by Frank Drake. This interdisciplinary book will benefit everybody trying to understand whether evolution and ethics are unique to Earth, or whether they are built into the fabric of the universe.

Teaching to the Brain's Natural Learning Systems-Barbara K. Givens 2002 Uses the brain's five major learning systems—emotional, social, cognitive, physical, and reflective—to provide a framework for designing lessons and determining teaching approaches.

The New Unified Theory of Psychology-Gregory Henriques 2011-08-17 Concern about psychology's fragmentation is not new, but there has for the past decade been increasing calls for psychologists to acknowledge to the costs associated with fragmentation and to seek ways for unify the discipline. A New Unified Theory of Psychology introduces a new system that addresses psychology's current theoretical and philosophical difficulties. The new theory consists of four interlocking pieces that together provide—for the first time—a macro-level view that clarifies the nature of psychology's problems and offers a clear way to unify the various elements of the field. The unified theory provides the field of psychology with a well-defined subject matter, allowing both academic and professional psychologists to be able to develop a shared language and conceptual framework.

The Actor, Image, and Action-Rhonda Blair 2007-11-30 The Actor, Image and Action is a 'new generation' approach to the craft of acting; the first full-length study of actor training using the insights of cognitive neuroscience. In a brilliant reenactment of both the practice and theory of acting, Rhonda Blair examines the psychological relationship between bodily action and emotional experience. In doing so she provides the latest step in Stanislavsky's attempts to help the actor 'reach the unconscious by conscious means'. Recent developments in scientific thinking about the connections between biology and cognition require new ways of understanding many elements of human activity, including: imagination emotion memory physicality reason. The Actor, Image and Action looks at how these are in fact inseparable in the brain's structure and function, and their crucial importance to an actor's engagement with the role. The book vastly improves our understanding of the actor's process and is a must for any actor or student of acting.

Global Justice Reform-Hiram Chodosh 2005 Global Justice Reform critiques and rethinks two neglected subjects: the nature of comparison in the field of comparative law and the struggles of national judicial systems to meet global rule of law objectives. Hiram Chodosh offers a candid look at the surprisingly underdeveloped methodology of comparative legal studies, and provides a creative conceptual framework for defining and understanding the whys, what, and hows of comparison. Additionally, Chodosh demonstrates how theories of comparative law translate into practice, understanding individual differences and their implications for the profession. Ultimately, Chodosh highlights the gap between the critical role of judicial institutions and their poor performance (for example, political interference, corruption, hacking, and delay), discussing why reform is so elusive, and demonstrating the unavoidable and essential role of comparison in reform proposals. Throughout the book, Chodosh identifies several sources of comparative misunderstanding that impede successful reforms and identifies the many predicaments reformers face, detailing a wide variety of designs, methods, and social dilemmas. In response to these seemingly insurmountable challenges, Chodosh advances some novel conceptual strategies, first by drawing on a body of non-legal scholarship on self-regulating, emergent systems, and then by identifying a series of anti-dilemma strategies that draw upon insights about the nature of comparison.

Archetype Revisited-Anthony Stevens 2015-06-05 Archetype: A Natural History of the Self, first published in 1982, was a ground-breaking book; the first to explore the connections between Jung's archetypes and evolutionary discourses such as ethology and sociology, and an excellent introduction to the archetypes in theory and practical application as well. C.G. Jung's 'archetypes of the collective unconscious' have traditionally remained the property of analytical psychology, and have commonly been dismissed as 'mystical' by scientists. But Jung himself described them as biological constants, which, if they exist at all, must be amenable to empirical study. In the work of Bowlby and Lorenz, and in studies of the bilateral brain, Anthony Stevens has discovered the key to opening up this long-neglected scientific approach to the archetypes, originally envisaged by Jung. At last, in a creative leap made possible by the cross-fertilization of several specialist disciplines, psychiatry can be integrated with psychology, with ethology and biology. The result is an immensely enriched science of human culture. In Archetype Revisited, Stevens considers the enormous cultural, social and intellectual changes that have taken place since the publication of the original edition, and includes: - An updated chapter on The Archetypal Masculine and Feminine, reflecting recent research findings on the role of the archetypes in modern psychology and psychiatry. - Analysis of what has happened to the archetype in terms of our understanding of it and our responses to it. This Classic Edition of the book includes a new introduction by the author.

Wild Justice-Marc Bekoff 2009-08-01 Scientists have long counseled against interpreting animal behavior in terms of human emotions, warning that such anthropomorphizing limits our ability to understand animals as they really are. Yet what are we to make of a female gorilla in a German zoo who spent days mourning the death of her baby? Or a wild female elephant who cared for a younger one after she was injured by a rampant teenage male? Or a rat who refused to push a lever for food when he saw that doing so caused another rat to be shocked? Aren't these clear signs that animals experience emotions? Yet until now there has been no comprehensive account of how animals feel. In Wild Justice Marc Bekoff and Patricia Pierce present a thorough understanding of animal emotions, explaining how they arise from years of behavioral and cognitive research with compelling and moving anecdotes, Bekoff and Pierce reveal that animals exhibit a broad repertoire of moral behaviors, including fairness, empathy, trust, and reciprocity. Underlying these behaviors is a complex and nuanced range of emotions, backed by a high degree of intelligence and surprising behavioral flexibility. Animals, in short, are incredibly adept social beings, relying on rules of conduct to navigate intricate social networks that are essential to their survival. Ultimately, Bekoff and Pierce draw the astonishing conclusion that there is no moral gap between humans and other species: morality is an evolved trait that we unquestionably share with other social mammals. Sure to be controversial, Wild Justice offers not just cutting-edge science, but a provocative call to rethink our relationship with—and our responsibilities toward—our fellow animals.

Human Evolution-John L. Bradshaw 2014-01-02 The last decade has seen an explosive burst of new information about human origins and our evolutionary status with respect to other species. We have long been considered unique as upright, bipedal creatures endowed with language, the ability to use tools, to think and introspect. We now know that other creatures may be more or less capable of similar behaviour, and that these human capacities in many cases have long evolutionary trajectories. Our information about such matters comes from a diverse variety of disciplines, including experimental and neuropsychology, primatology, ethology, archaeology, palaeoanthropology, comparative linguistics and molecular biology. It is the interdisciplinary nature of the newly-emerging information which bears upon one of the most profound scientific human questions - our origin and place in the animal kingdom, whether unique or otherwise - which makes the general topic so fascinating. In this comprehensive book, John L. Bradshaw expertly presents the facts and discussions on relevant areas of interest, providing a fascinating account of the extraordinary development of an increased capacity for sociality and organization, crucial for survival on the African savanna. All apes display a propensity for weak ties, individualism, mobility, and autonomy that was, and is today, useful in arboreal and woodland habitats but served them poorly when our ancestors began to move onto the African plain during the late Miocene. The challenge for natural selection was to enhance the traits in the species that would foster the social ties necessary for survival in the new environment. The author suggests that the result was a development of certain areas of the primate brain that encouraged strong emotional ties, allowing our ancestors to build higher levels of social solidarity. Our basic neurological wiring continues to reflect this adaptive development. From a sociological perspective that is informed by evolutionary biology, primatology, and neurology, the book examines the current neurological bases of our emotional repertoire and their implications for our social actions.
Consciousness and Science Fiction - Damien Broderick 2018-11-30 Science fiction explores the wonderful, baffling and wildly entertaining aspects of a universe unimaginably old and vast, and with a future even more immense. It reaches into that endless cosmos with the tools of rational investigation and storytelling. At the core of both science and science fiction is the engaged human mind—a consciousness that sees and feels and thinks and loves. But what is this mind, this aware and self-aware consciousness that seems unlike anything else we experience? What makes consciousness the Hard Problem of philosophy, still unsolved after millennia of probing? This book looks into the heart of this mystery - at the science and philosophy of consciousness and at many inspiring fictional examples - and finds strange, challenging answers. The book's content and entertaining style will appeal equally to science fiction enthusiasts and scholars, including cognitive and neuroscientists, as well as philosophers of mind. It is a refreshing romp through the science and science fiction of consciousness.

Simulating Minds - Alvin 1. Goldman 2006-07-06 We have thoughts, feelings and emotions, and we grasp our own mental states, and conduct the business of ascribing them to ourselves and others without instruction in formal psychology. How do we do this? This book explores these questions.

Deep Learning - Stellan Ohlsson 2011-01-31 Although the ability to retain, process, and project prior experience onto future situations is indispensable, the human mind also possesses the ability to override experience and adapt to changing circumstances. Cognitive scientist Stellan Ohlsson analyzes three types of deep, non-monotonic cognitive change: creative insight, adaptation of cognitive skills by learning from errors, and conversion from one belief to another, incompatible belief. For each topic, Ohlsson summarizes past research, re-formulates the relevant research questions, and proposes information-processing mechanisms that answer those questions. The three theories are based on the principles of redistribution of activation, specialization of practical knowledge, and re-subsumption of declarative information. Ohlsson develops the implications of those mechanisms by scaling their effects with respect to time, complexity, and social interaction. The book ends with a unified theory of non-monotonic cognitive change that captures the abstract properties that the three types of change share.

Stone Age Present - William Allman 1995-11-07 The first popular-sciences book to move beyond the “nature versus nurture” debate and illuminate how the legacy of our ancient ancestors profoundly influences our contemporary behavior and moral values. This fascinating synthesis of biology, anthropology, psychology, and other disciplines, William Allman traces the development of humankind and human communities.

Language, Feeling, and the Brain - Daniel Shanahan 2011-12-31 Linguistic theory since the Cognitive Revolution has folowed one of the premises of that revolution by largely sideling the issue of emotions and concentrating on those aspects of language that are more strictly cognitive. However, during the last ten years research in cognitive science, especially in neuropsychology, has begun to fill in the gaps left by the exclusion of emotions from cognitive research. The work of those like Oatley, Zajonc, Damasio, and LeDoux, to name a few, has demonstrated both that it is possible to construct models of how emotions play into the workings of the psyche and that they are necessary in giving us a balanced view of the human mind. Language, Feeling, and the Brain attempts to apply the fruits of this new research in emotion to our understanding of language itself. Building on Karl Piatnitz's integrated model of emotions and motivations, the book takes an eclectic approach to explaining how emotions contribute to the nature of language, drawing on research done in neuropsychology, philosophy, cognitive linguistics, anthropology, and related fields. Its aim is to construct a propositional model for how the emotions may have contributed to the emergence of symbolic formation, most especially in the forms of gesture and speech, and how identifying that emotional influence sheds new light on everything we have had to say about language itself, from lexis and grammar to culture and literature.

Building a Popular Science Library Collection for High School to Adult Learners - Gregg Sapp 1995 Discusses science literacy, recommends reference resources, and presents annotated bibliographies for nine subject areas featuring print and nonprint titles

The Affect Effect - W. Russell Neuman 2007-09-15 Passion and emotion run deep in politics, but researchers have only recently begun to study how they influence our political thinking. Contending that the long-standing neglect of such feelings has left unfortunate gaps in our understanding of political behavior, The Affect Effect fills the void by providing a comprehensive overview of current research on emotion in politics and where it is likely to lead. In sixteen seamlessly integrated essays, thirty top scholars approach this topic from a broad array of angles that address four major themes. The first section outlines the philosophical and neuroscientific foundations of emotion in politics, while the second focuses on how emotions function within and among individuals. The final two sections branch out to explore how politics work at the societal level and suggest the next steps in modeling, research, and political activity itself. Opening up new paths of inquiry in an exciting new field, this volume will appeal not only to scholars of American politics and political behavior, but also to anyone interested in political psychology and sociology.

Missing the Revolution - Jerome H. Barkow 2006 The essays in this volume present applications of evolutionary psychology in a manner intended to illustrate their relevance to current concerns for social scientists and are aimed at those researchers who, in the editor's opinion, have been missing the evolution-revolution to engage with Darwinian thought.

Campainging for Hearts and Minds - Ted Brader 2006 Useful for those wishing to understand how American politics is influenced by advertising, this scientific study examines the effects these emotional appeals in political advertising have on voter decision-making.

Mimesis and the Human Animal - Robert Storey 1996-12-16 In Mimesis and the Human Animal, Robert Storey argues that human culture derives from human biology and that literary representation therefore must have a biological basis. As he ponders the question “What does it mean to say that art imitates life?” he must consider both “What is life?” and “What is art?” A unique approach to the subject of mimesis, Storey’s book goes beyond the politicizing of literature grounded in literary theory to develop a scientific basis for the creation of literature and art.

Evolutionary Epistemology, Language and Culture - Nathalie Gontier 2016-07-25 For the first time in history, scholars working on language and culture from within an evolutionary epistemological framework, and thereby emphasizing complementary or deviating theories of the Modern Synthesis, were brought together. Of course there have been excellent conferences on Evolutionary Epistemology in the past, as well as numerous conferences on the topics of Language and Culture. However, until now these disciplines had not been brought together into one all-encompassing conference. Moreover, previously there never had been such stress on alternative and complementary theories of the Modern Synthesis. Today we know that natural selection and evolution are far from synonymous and that they do not explain isomorphic phenomena in the world. “Taking Darwin seriously” is the way to go, but today the time has come to take alternative and complementary theories that developed after the Modern Synthesis, equally seriously, and, furthermore, to examine how language and culture can merit from these diverse disciplines. As this volume will make clear, a specific inter- and transdisciplinary approach is one of the next crucial steps that needs to be taken, if we ever want to unravel the secrets of phenomena such as language and culture.
